Kawasaki Precision Machinery

SAFETY PRECAUTIONS

Before you use the product, you **MUST** read the operation or operators manual and **MUST** fully understand how to use the product.

To use the product safely, you **MUST** carefully read all Warnings and Cautions in this manual. You **MUST** also observe the related regulations and rules regarding safety.

■ Cautions related to operation

- ①  CAUTION Use the safety equipment to avoid the injury when you operate the product.
- ②  CAUTION Pay enough attention on handling method to avoid pinching hands or back problems that may be caused by heavy weight of the product or handling posture.
- ③  CAUTION Do not step on the product, hit it, drop it or give strong outside force to it, as one of these actions may cause the failure of work, damage or oil leakage.
- ④  CAUTION Wipe the oil on the product or floor off completely, as the oil creates slippery conditions that may result in dropping the product or injuring.

■ Warnings and Cautions related to installation and removal of the product

- ①  CAUTION Installation, removal, plumbing, and wiring must be done by the certified person.
*CERTIFIED PERSON: a person who has enough knowledge like a person who is trained by Kawasaki's hydraulic school.
- ②  WARNING Make it sure that the power of the hydraulic power unit is turned off and that the electric motor or engine has completely stopped before starting installation or removal. You must also check the system pressure has dropped to zero.
- ③  WARNING Turn off the power before starting wiring or other works related to the electric power, otherwise you may be stuck by an electric shock.
- ④  CAUTION Clean the threads and mounting surface completely, otherwise you may experience damages or oil leakage caused by insufficient tightening torque or broken seal.
- ⑤  CAUTION Use the specified bolts and keep the specified tightening torque when you install the product. Usage of unauthorized bolts, lack of torque or excess of torque may create problems such as failure of work, damage and oil leakage.

■ Warnings and Cautions for operation

- ①  DANGER Never use the product not equipped with anti-explosion protection in the circumstances of possible explosion or combustion.
- ②  WARNING Shield the rotating part such as motor shaft and pump shaft to avoid injuries caused by being caught of fingers or cloths.
- ③  WARNING Stop the operation immediately if you find something wrong such as unusual noise, oil leakage or smoke, and fix it properly. If you continue operating, you may encounter damage, fire or injury.
- ④  CAUTION Make it sure that plumbing and wiring are correct and all the connection is tightened correctly before you start operating, especially if it is the first run.
- ⑤  CAUTION Use the product under the specification mentioned in the catalog, drawings and specification sheet.
- ⑥  CAUTION Keep your body off the product during the operations as it may become hot and burn your body.
- ⑦  CAUTION Use the proper hydraulic oil, and maintain the contamination in the recommended level, otherwise it may not work or be damaged.

■ Cautions related to maintenance

- ①  CAUTION Never modify the product without approval of Kawasaki.
- ②  CAUTION Do not disassemble and assemble without approval by Kawasaki. It may cause troubles and failure, or it may not work as specified. If it is necessary by all means to disassemble and assemble, it must be done by an authorized person.
- ③  CAUTION Keep the product from dust and rust by paying attention to the surrounding temperature and humidity when you transport or store the product.
- ④  CAUTION Replacing the seals may be required if you use the product after long time storage.

Kawasaki M2X/M5X Series

High Performance Motors for Swing Applications

The product you have been waiting for...

FEATURES

1. Compact

The design provides for an extraordinarily compact motor whereby the motor's rotating group, integral mechanical brake element and the attached valve options are neatly packaged together. Assembling the mechanical brake around the rotating group means that there is no configurational difference in motor installation which allows the optional provision of a brake.

2. Constructed specifically for Swing Operation

The motor's rotating group has been designed specifically for an excavator swing circuit and is based upon the abundant experience gained with the K series, N series and M series units on which Kawasaki's good customer reputation has been made.

3. Integrated Valving

Since the motor has built-in relief valve and make-up valve elements within the motor's valve block head cover, the connection of the piping from the control valve to the motor ports enables the motor to achieve swing function.

4. Directly Connected to Reduction Gear

The mounting flange of the motor has been enlarged so as to enable it to be directly connected with the ring gear of the reduction gear box.

SPECIFICATIONS

Model		M2X63	M5X130	M5X180	M2X210	
Displacement		cm ³	64.0	129.2	180.1	210.1
Pressure MPa (kgf/cm ²)	Rated *1	29.4 (300)	32.4 (330)	32.4 (330)	29.4 (300)	
	Maximum *2	34.3 (350)	39.2 (400)	39.2 (400)	34.3 (350)	
Maximum speed *3		min ⁻¹	2,200	1,850	1,680	1,400
Rated output torque *4		N·m (kgf·m)	300 (31)	670 (68)	932 (95)	980 (100)
Rated output power *5		kW	69	129	163	144
Brake	Applicable maximum brake torque	N·m (kgf·m)	314 (32)	843 (86)	1,250 (127)	1,380 (141)
	Release pressure	MPa (kgf/cm ²)	2.3 (23)	3.4 (34)	3.3 (33)	3.4 (35)
	Maximum allowable release pressure	MPa (kgf/cm ²)	4.9 (50)			
Mass		kg	29	47	61	66

*1 Pressure to allow guarantee of performance, functions and service life. Durability is unlimited (except for the bearing life).

*2 Pressure to allow the setting which enables operation with no functional problems. Durability and service life are limited. Please consult us for details.

*3 The suction pressure should be 0.1 MPa (1kgf/cm²) or above.

The maximum speed which can be achieved without functional problems. In some cases, operating pressure and/or flow will be limited.

*4 The theoretical value at the rated pressure excluding mechanical efficiency.

*5 The theoretical value at the rated pressure and maximum speed excluding both mechanical and volumetric efficiencies.

CONSTRUCTION · OPERATION PRINCIPLE

1. Hydraulic Motor

As shown in the figure below, the high pressure oil passes through the inlet port (a) and flows into the cylinder block (4). Hydraulic force thus acts upon the piston (5), generating an axial force F . This force F is resolved through the shoe (2) into vector force F_1 which acts perpendicular to the swash plate (3), and vector force F_2 which is a vertical force with respect to the output shaft. The reaction force of force F_2 is transmitted via the piston to the cylinder block, generating a rotational force which turns the output shaft. There are 9 equally spaced pistons in the cylinder block. The pistons connected to the high pressure inlet port transmit rotational torque sequentially to the output shaft. Reversing the flow of operating oil causes the output shaft to rotate in the opposite direction of rotation.

2. Parking Brake

This is a negative type, oil lubricated, multi-disc parking brake. That means that when the motor is not being operated, the brake piston (8) is pushed leftward by the springs (7) and the resultant friction through the separator plates restricts the rotation of the drive shaft from being able to rotate. If, however, a release pressure is applied through the release port to the oil chamber (6) such that the pressure force so generated is larger than the spring force, then the brake piston (8) moves to the right thereby providing a clearance between the individual separator plates. The brake is thereby released and the drive shaft can rotate freely.

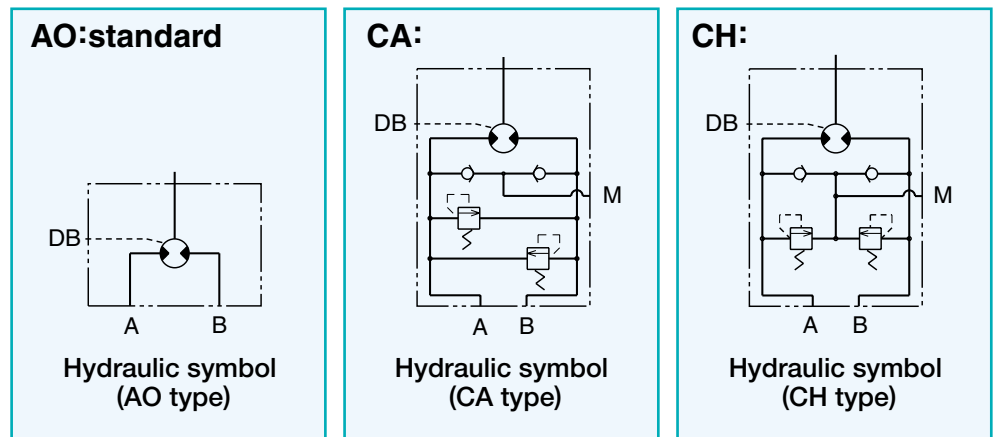

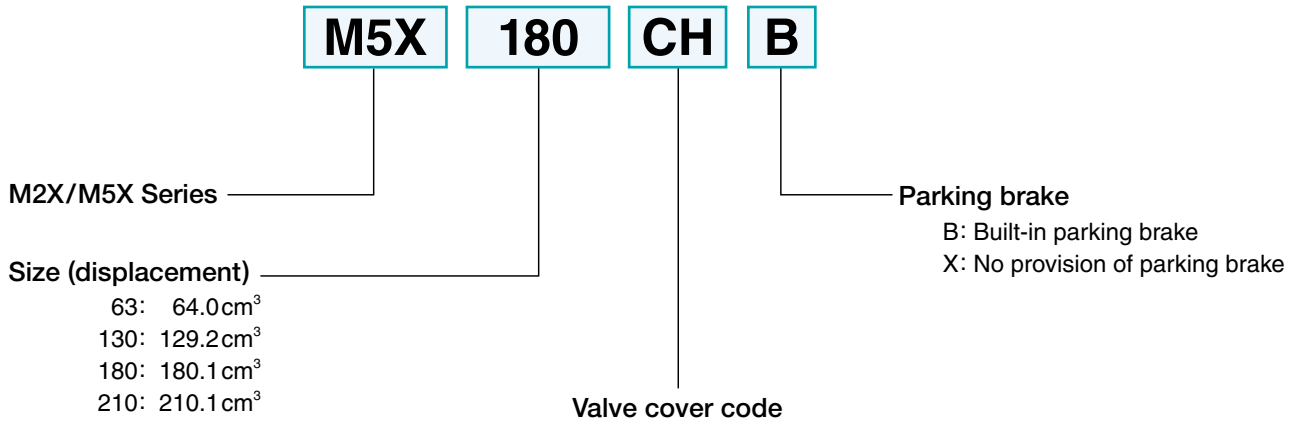

● Reference

Data are indicated in both the SI units and the gravitational units. The relationship between these two units are shown for reference.

SI units	gravitational units	
9.807 MPa	1,450 lbf/ft ²	100 kgf/cm ²
9.807 N·m	7,233 lbf·ft	1 kgf·m
0.735 kW	0.986 HP	1 PS
1 mm ² /s	1 cSt	1 cSt

ORDERING CODE

■ M2X/M5X Series Motor

■ M2X/M5X-RG Series Motor

ATTACHED VALVE

■ Relief valve (standard equipment in CA and CH type)

The relief valves built into M2X/M5X series motors have an excellent pressure override characteristic.

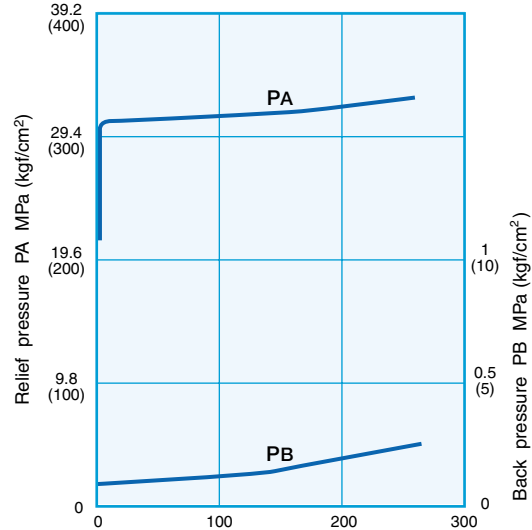

In addition this relief valve utilises a rate sensing technique to control the rate of pressure increase.

Due to the addition of this function motor acceleration and deceleration can be controlled with a minimum of shock.

● Pressurizing speed characteristics

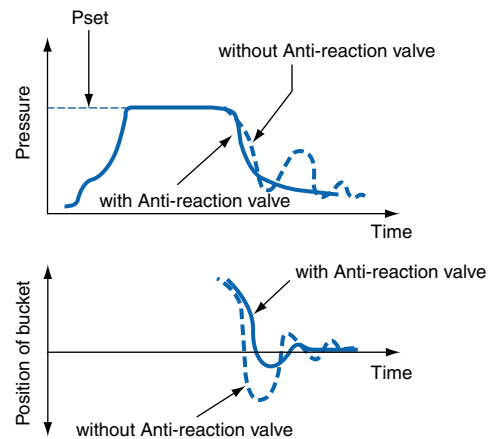

● Pressure override characteristics

■ Anti-reaction valve (option)

When the operator wishes to decrease the jerkiness of swing operation, the anti-reaction valve option should be used whose examples of effects are shown in the figure to the right.

● Effect of the anti-reaction valve

■ Time delay valve for parking brake (option)

It is important that the brake is only operated after the motor shaft has completely stopped.

The operating start time for brake applications should therefore be delayed to take into account all inertia conditions.

The valve has a function to delay the operating start time for brake application by installing it at the brake release port of the motor.

CAUTION FOR OPERATING

CAUTION

1. Operating fluid and temperature range

- ① Please use antiwear hydraulic fluid as operating fluid.
- ② The allowable ranges of operating fluid are as follows.
Viscosity: 10 ~ 1,000 mm²/s (cSt)
Temperature: -20 ~ +90°C
- ③ In case of using special fluid (Phosphate ester compounds, water-glycol fluid, fatty acid ester compounds, etc.) please consult us for instructions prior to use.

CAUTION

2. Filtration

For satisfactory service life of these motors application, the operating fluid should be controlled cleaner than the cleanliness level of NAS1638 Class9. Install a 10 μm filter in the return circuit of respective actuators.

CAUTION

3. Mounting

- ① The motor should be installed with the shaft either horizontal or vertically down.
- ② Alignment should be so carried out that the parallel error may be held within ±0.05 mm.

CAUTION

4. Drain piping

- ① The motor's drain port, as shown in the following figure, should be so located that the casing can be filled with oil.
- ② Use a drain tube bigger in size than the motor's port. Keep the casing pressure normally below 0.2 MPa (2kgf/cm²) and below 0.6 MPa (6kgf/cm²) even at the peak.

CAUTION

5. Oil filling and air venting

Before operation, be sure to fill the casing with oil through the drain port (DB port). Vent all air out of the motor and hydraulic circuit prior to operation. The insufficient amount of oil may cause the lubrication failure, resulting in the seizure of internal parts. The values given in the table below are the amount of oil in the motor case.

Model	M2X63	M2X130	M2X180	M2X210
Amount of oil (L)	0.5	0.8	1.0	1.5

WARNING

6. Parking brake

This brake should be used only for parking, are not for dynamic braking. In case of driving inertial load, measures such as the adoption of the time delay valve should be taken to prevent the parking brake from being activated before the inertial mass stops.

WARNING

7. Radial and thrust load

- ① Do not apply radial or thrust load to the shaft of these motors. In case of possible occurrence of the above-stated load at the shaft, provide an additional bearing unit on the driven side.
- ② In case the sun gear of a planetary gear box is driven, the above-stated bearing unit is not always required. However, careful alignment should be carried out to avoid unbalance force to the shaft from the gear box.
- ③ Radial or thrust load may be applied to the shaft of the M2X/M5X-RG Series. Such load, however, will affect the bearing life and the shaft strength. Refer to the data on page 15.

CAUTION

8. Cavitation

When the motor is operating in an overrunning (pumping) mode, then to prevent the occurrence of cavitation, a positive boost pressure is required at the M port or the suction port. Please ensure that the minimum boost pressure requirement shown in the model performance data is always available.

CAUTION

9. Back pressure

The lower of the two main motor ports pressures should always be less than 2.5 MPa (25kgf/cm²). Pressure higher than this could cause a possible reduction in motor performance. In case of any doubt please consult.
